

Anatomy Scavenger Hunt Instructions & Tips

- ✓ Use your textbook, anatomical charts/handouts in class and/or the Internet to correctly identify the structures listed on the scavenger hunt
 - Scavenger hunts are almost always to be completed **independently**, that is, without the help of classmates
- ✓ Use *pencil* to complete your scavenger hunts
 - Mistakes are inevitable and scavenger hunts are scored for accuracy, not just completion
 - Writing space can be limited so it is critical your answers be legible
- ✓ Identify structures using the anatomical name provided on your scavenger hunt, not:
 - Names from sources you used to identify the structure (e.g. "Body of Sternum" is provided on your scavenger hunt, but some diagrams may denote "Sternum") and/or
 - Layperson terminology (e.g. "Body of Sternum" is correct, "Breastbone" is incorrect for credit)
- ✓ Sometimes an anatomical structure may be labeled more than once throughout the scavenger hunt's diagrams
 - This is *not* a mistake and you should identify structures accordingly; this is done to help learn anatomy from various perspectives
- ✓ Sometimes anatomical structures are listed, but do not have a corresponding arrow to identify it
 - Again, this is *not* a mistake but a reminder that the anatomy is important and you should know its location through other sources besides your scavenger hunt
 - Such structures are often in *italics* or have an asterisk (*) indicating you do not need to label the structure(s) on the scavenger hunt
